Section 1 : Coding

1. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters.At least one digit.At least one special character from !@#$%^&* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

Input Format

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

Output Format

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: John
9874563210
john
john1#nhoj
Output: Valid Password

Answer

```
# You are using Python
class PasswordValidationError(Exception):
    pass

def validate_password(password):
    if not any(char.isdigit() for char in password):
        raise PasswordValidationError("Should contain at least one digit")
    special_chars = "!@#$%^&*"
    if not any(char in special_chars for char in password):
        raise PasswordValidationError("It should contain at least one special
character")
    if not (10 <= len(password) <= 20):
        raise PasswordValidationError("Should be a minimum of 10 characters and
a maximum of 20 characters")
    return "Valid Password"

if __name__ == "__main__":
    name = input()
```

```
mobile = input()
username = input()
password = input()
try:
    result = validate_password(password)
    print(result)
except PasswordValidationError as e:
    print(e)
```

Status : Partially correct ***Marks : 6.5/10***

2. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted_names.txt.

Input Format

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

Output Format

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Alice Smith
John Doe
Emma Johnson
q

Output: Alice Smith
Emma Johnson
John Doe

Answer

```
def name_sorter():
    filename = "sorted_names.txt"
    names = []

    #print("Enter names one per line (type 'q' to finish):")
    while True:
        name = input()
        if name.strip().lower() == 'q':
            break
        if 3 <= len(name) <= 30:
            names.append(name)
        else:
            print("Name must be between 3 and 30 characters.")

    # Sort names alphabetically
    names.sort()

    # Write to file
    with open(filename, 'w') as file:
        for name in names:
            file.write(name + '\n')

    # Display sorted names
    #print("\nSorted Names:")
    with open(filename, 'r') as file:
        for line in file:
            print(line.strip())

# Run the program
name_sorter()
```

Status : Correct ***Marks : 10/10***

3. Problem Statement

Bob, a data analyst, requires a program to automate the process of

analyzing character frequency in a given text. This program should allow the user to input a string, calculate the frequency of each character within the text, save these character frequencies to a file named "char_frequency.txt," and display the results.

Input Format

The input consists of the string.

Output Format

The first line prints "Character Frequencies:".

The following lines print the character frequency in the format: "X: Y" where X is the character and Y is the count.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: aaabbbccc
Output: Character Frequencies:
a: 3
b: 3
c: 3

Answer

```
# You are using Python
from collections import Counter

def analyze_character_frequency():
    input_string = input()
    char_counts = Counter(input_string)
    seen_chars = set()

    try:
        with open("char_frequency.txt", 'w') as outfile:
            outfile.write("Character Frequencies:\n")
            for char in input_string:
```

```
            if char not in seen_chars:
                outfile.write(f"{char}: {char_counts[char]}\n")
                seen_chars.add(char)
    except IOError:
        print("Error: Could not write to file.")
        return

    print("Character Frequencies:")
    seen_chars_print = set()
    for char in input_string:
        if char not in seen_chars_print:
            print(f"{char}: {char_counts[char]}")
            seen_chars_print.add(char)

if __name__ == "__main__":
    analyze_character_frequency()
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an IllegalArgumentException. If the Mobile Number contains any character other than a digit, raise a NumberFormatException.If the Register Number contains any character other than digits and alphabets, throw a NoSuchElementException.If they are valid, print the message ‘valid’ or else print an Invalid message.

Input Format

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

Output Format

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 19ABC1001
9949596920
Output: Valid

Answer

```
# You are using Python

import re

class IllegalArgumentException(Exception):
    pass

class NumberFormatException(Exception):
    pass

class NoSuchElementException(Exception):
    pass

def validate_student_details(reg_num, mob_num):
    if len(mob_num) != 10:
        raise IllegalArgumentException("Mobile Number should have exactly 10 characters.")
    if not mob_num.isdigit():
        raise NumberFormatException("Mobile Number should only contain digits.")
    if len(reg_num) != 9:
        raise IllegalArgumentException("Register Number should have exactly 9 characters.")
    if not reg_num.isalnum():
        raise NoSuchElementException("Register Number should contain only digits and alphabets.")
```

```
    reg_num_pattern = r"^\d{2}[a-zA-Z]{3}\d{4}$"
    if not re.match(reg_num_pattern, reg_num):
        raise IllegalArgumentException("Register Number should have the format: 2
numbers, 3 characters, and 4 numbers.")
    print("Valid")

if __name__ == "__main__":
    register_number = input()
    mobile_number = input()
    try:
        validate_student_details(register_number, mobile_number)
    except (IllegalArgumentException, NumberFormatException,
NoSuchElementException) as e:
        print(f"Invalid with exception message: {e}")
    except Exception as e:
        print(f"An unexpected error occurred: {e}")
```

Status : Correct **Marks : 10/10**
